

# GIMP: The point of view from a 12 year old

- GIMP (Gnu Image Manipulation Program) is a photo editing program/paint program (Kind of)
- GIMP is really the free version of Photoshop (YAY FOR FREE STUFF!)
- GIMP has many different uses (Just like Photoshop, really) and is very versatile
- GIMP has a semi hard learning curve, but once you learn it all goes well, and you can use it successfully ~

# Basics- Negatives and Positives

- Paint negatives and positives-- The paint is very smooth, but it just doesn't agree with the fill tool.
- The pencil tool is rough (very pixelly and non-rounded) but it fills correctly.
- The fill tool is (as said above) doesn't work very well with the smooth paint tool, but does fine with the pencil.
- The blur tool doesn't blur very hard, but it is actually quite useful.

# Non-basics-Negatives and Positives

- The gradient is actually quite easy to use, but it is a bit strange to use-- I guess there is a slight learning curve to it.
- The shear/perspective is rather hard too use, there are numbers instead of sliders...
- Some of the things are rather hard to use and I haven't understood them yet.

# Pictures. I have them.

- Oh noes pictures! Are you ready to experience their brilliance?
- Disregard the bullet points.
- They are no use.
- I am quite sure that they are useless for now.
- Enough. I shall show you the pictures.

# Part 2: Shading

- Shading is a very vital ability for art... But I am not very good with it, oops.

Here's my attempt at shading. ... It's not the best...

**I think I am done.**

**SO YOU CAN STOP COVERING YOUR  
EARS.**

Just kidding. I hope you liked our presentation(s)!
